

INTERA System

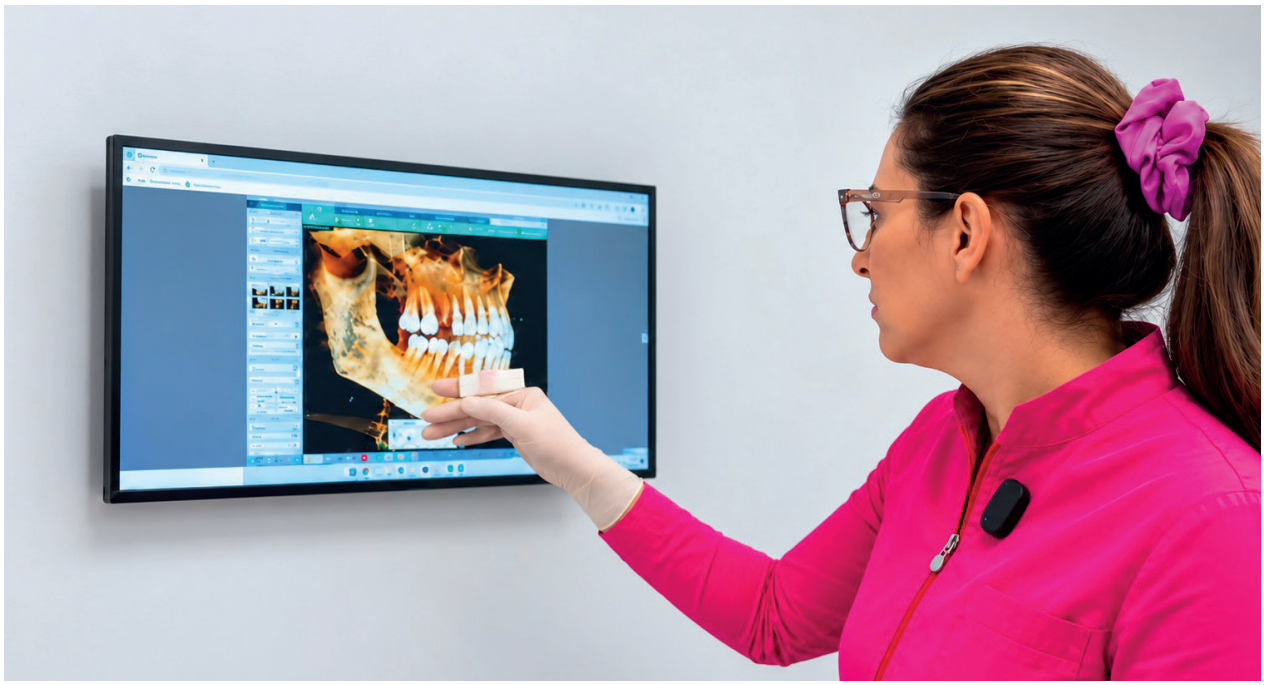

CLINICAL WORKFLOW, WITHOUT INTERRUPTIONS

Wireless hands-free PC control and voice dictation for clinical practice

INTERACTION GOES HANDS-FREE

During dental procedures, reviewing diagnostic images, navigating clinical software and updating patient records often require clinicians to pause their work to use a mouse and keyboard, increasing contact with these devices.

INTERA System is a wireless system for hands-free PC control. It helps reduce interruptions and contact with input devices, supporting a more continuous clinical workflow and better coordination between dentists, dental assistants and reception staff.

BENEFITS FOR THE CLINICAL WORKFLOW

CONTROL YOUR PC WITH WEARABLE TRACKING

The wearable tracking module can be positioned to suit the clinician’s needs, allowing movement to guide the cursor.

REVIEW IMAGES AND CLINICAL CONTENT

Explore CBCT scans and diagnostic images, zoom in and use your existing software tools.

DICTATE DIRECTLY INTO YOUR SOFTWARE

Use voice dictation to enter treatment notes and other clinical information directly into text fields in the software used at your practice.

MAINTAIN HIGH STANDARDS OF HYGIENE

Reduce contact with the mouse and keyboard during clinical work, limiting interruptions associated with glove hygiene.

MOVEMENT BECOMES CONTROL

Dr Barbara Sabiu · Dentist, creator of the Sabiu Protocol

In Dr Barbara Sabiu's configuration, the tracking module is worn on a finger, like a ring, allowing her to control the cursor through hand movements.

This is one of several ways to use INTERA System. The multifunction foot pedal and voice dictation complete the set-up, enabling PC interaction without using a mouse or keyboard.
